MINIKANREN: Relational Programming Language (Family)

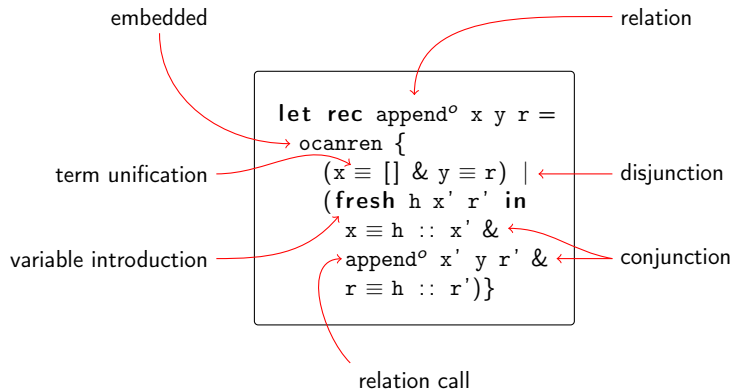

embedded

relation

```
let rec appendo x y r =  
  ocanren {  
    (x ≡ [] & y ≡ r) |  
    (fresh h x' r' in  
      x ≡ h :: x' &  
      appendo x' y r' &  
      r ≡ h :: r')}
```

MINIKANREN: Relational Programming Language (Family)

```
let rec appendo x y r =  
  ocanren {  
    (x ≡ [] & y ≡ r) |  
    (fresh h x' r' in  
      x ≡ h :: x' &  
      appendo x' y r' &  
      r ≡ h :: r'))}
```

- **fresh** q in append^o [1] [2] q
 - $\langle q \rightarrow [1,2] \rangle$

MINIKANREN: Querying

```
let rec appendo x y r =  
  ocanren {  
    (x ≡ [] & y ≡ r) |  
    (fresh h x' r' in  
      x ≡ h :: x' &  
      appendo x' y r' &  
      r ≡ h :: r'))}
```

- **fresh** q in append^o [1] [2] q
 - $\langle q \rightarrow [1,2] \rangle$
- **fresh** x, y in append^o x y [1,2]
 - $\langle x \rightarrow [], y \rightarrow [1,2] \rangle$
 - $\langle x \rightarrow [1], y \rightarrow [2] \rangle$
 - $\langle x \rightarrow [1,2], y \rightarrow [] \rangle$

MINIKANREN: Querying

```
let rec appendo x y r =  
  ocanren {  
    (x ≡ [] & y ≡ r) |  
    (fresh h x' r' in  
      x ≡ h :: x' &  
      appendo x' y r' &  
      r ≡ h :: r'))}
```

- **fresh** q in append^o [1] [2] q
 - $\langle q \rightarrow [1,2] \rangle$
- **fresh** x, y in append^o x y [1,2]
 - $\langle x \rightarrow [], y \rightarrow [1,2] \rangle$
 - $\langle x \rightarrow [1], y \rightarrow [2] \rangle$
 - $\langle x \rightarrow [1,2], y \rightarrow [] \rangle$
- **fresh** x, y, z in append^o x y z
 - $\langle x \rightarrow [], y \rightarrow _0, z \rightarrow _0 \rangle$
 - $\langle x \rightarrow [_0], y \rightarrow _1, z \rightarrow (_0 : _1) \rangle$
 - ...

- Interleaving search
- Complete search
 - All existing answers will be eventually found
 - It is safe to reorder within conjunctions and disjunctions
 - Reordering affects the efficiency of programs

Relational Interpreters for Search Problems

Recognizer run backwards = solver

- Write a recognizer in a functional language
- Run relational conversion to get a relational interpreter from the recognizer
- Run the relational interpreter backwards

Core issue: running relational interpreter backwards is slow

Possible solution: partial deduction

Partial Deduction: a Method to Improve Logic Programs

input program

```
let rec evalo fm s r =  
  fm ≡ neg x & noto a r & evalo x s a |  
  ...
```

Partial Deduction: a Method to Improve Logic Programs

input program

```
let rec evalo fm s r =  
  fm ≡ neg x & noto a r & evalo x s a |  
  ...
```

known argument

```
evalo fm s true ←
```

Partial Deduction: a Method to Improve Logic Programs

input program

```
let rec evalo fm s r =  
  fm ≡ neg x & noto a r & evalo x s a |  
  ...
```

known argument

```
evalo fm s true ←
```

```
fm ≡ neg x & noto a true & evalo x s a |  
...
```

Partial Deduction: a Method to Improve Logic Programs

input program

```
let rec evalo fm s r =  
  fm ≡ neg x & noto a r & evalo x s a |  
  ...
```

known argument

```
evalo fm s true ←
```

```
fm ≡ neg x & noto a true & evalo x s a |  
...
```

```
fm ≡ neg x & evalo x s false |  
...
```

Partial Deduction: a Method to Improve Logic Programs

input program

```
let rec evalo fm s r =  
  fm ≡ neg x & noto a r & evalo x s a |  
  ...
```

known argument

```
evalo fm s true ←
```

```
fm ≡ neg x & noto a true & evalo x s a |  
...
```

```
fm ≡ neg x & evalo x s false |  
...
```

...

Partial Deduction: a Method to Improve Logic Programs

input program

```
let rec evalo fm s r =  
  fm ≡ neg x & noto a r & evalo x s a |  
  ...
```

known argument

```
evalo fm s true
```

```
fm ≡ neg x & noto a true & evalo x s a |  
...
```

```
fm ≡ neg x & evalo x s false |  
...
```

...

output

```
let rec eval_trueo fm s =  
  fm ≡ neg x & eval_falseo x s |  
  ...  
  
let rec eval_falseo fm s =  
  fm ≡ neg x & eval_trueo x s |  
  ...
```

Partial Deduction for MINIKANREN: Bird's-eye View

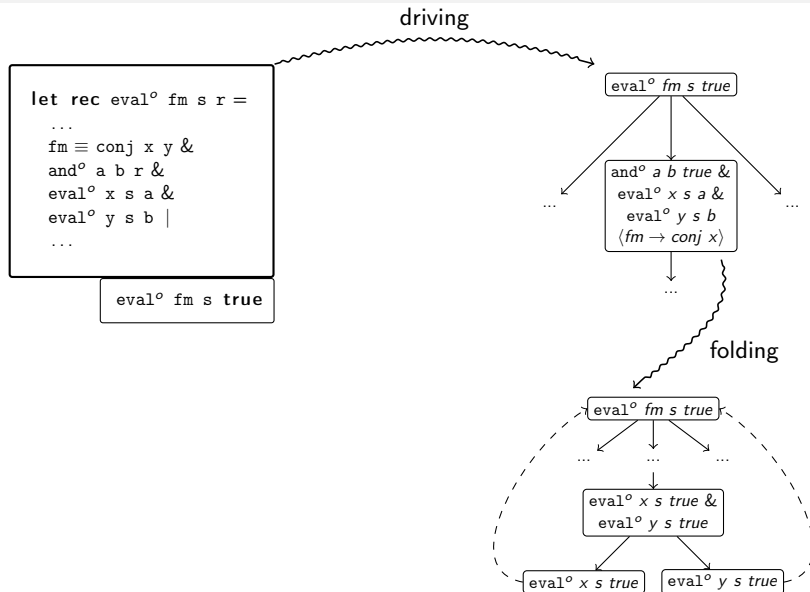

```
let rec evalo fm s r =  
  ...  
  fm ≡ conj x y &  
  ando a b r &  
  evalo x s a &  
  evalo y s b |  
  ...
```

```
evalo fm s true
```

```

eval^o fm s true

Conjunctive Partial Deduction: Left-to-right Unfolding

```
let rec evalo fm s r =  
  ...  
  fm ≡ conj x y & ando a b r &  
  evalo x s a & evalo y s b |  
  ...
```

eval^o fm s true

CPD: Split is Necessary

```
let rec evalo fm s r =
```

```
...
```

```
fm ≡ conj x y & ando a b r &
```

```
evalo x s a & evalo y s b |
```

```
...
```

```
evalo fm s true
```

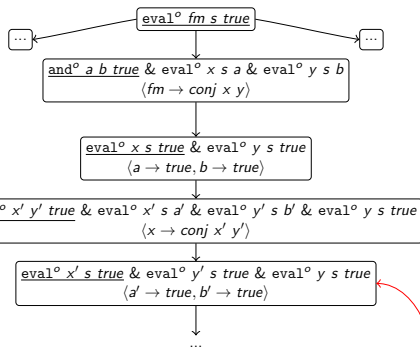

uncontrollable growth

CPD: Split is Necessary

```
let rec evalo fm s r =
```

```
...  
fm ≡ conj x y & ando a b r &  
evalo x s a & evalo y s b |  
...
```

```
evalo fm s true
```

uncontrollable growth

Split: Which Way is the Right Way?

Decisions in Partial Deduction

- What to unfold: which calls, how many calls?
 - CPD: the leftmost call, which does not have a predecessor *embedded* into it
- How to unfold: to what depth a call should be unfolded?
 - CPD: unfold once
- When to stop driving?
 - When a goal is an instance of some goal in the process tree
- When to split?
 - When there is a predecessor embedded into the goal

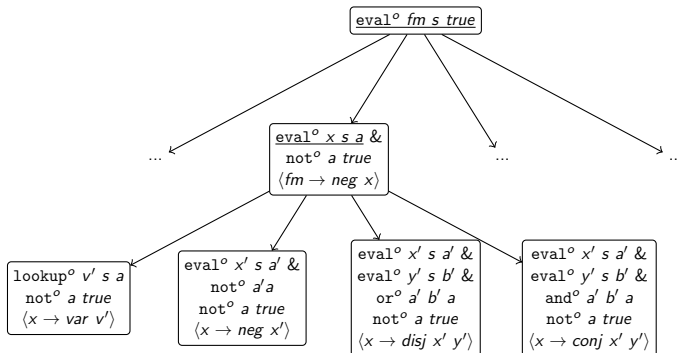

Evaluator of Logic Formulas: Unfolding Step 1

```
let rec evalo fm s r =  
  ocanren { fresh v x y a b in  
    (fm ≡ var v & lookupo v s r) |  
    (fm ≡ neg x & evalo x s a & noto a r) |  
    (fm ≡ conj x y & evalo x s a & evalo y s b & ando a b r) |  
    (fm ≡ disj x y & evalo x s a & evalo y s b & oro a b r) }
```

eval^o fm s true

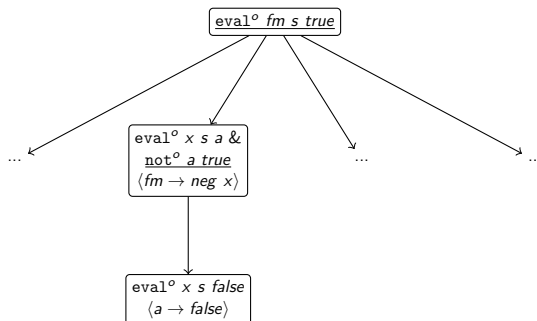

Evaluator of Logic Formulas: Unfolding Step 2

Unfolding of Boolean Connectives

Unfolding Boolean Connectives First

Evaluator of Logic Formulas: Conservative PD

Evaluator of Logic Formulas: Conservative PD

Conservative Partial Deduction

- Split conjunction into individual calls
- Unfold each call in isolation
- Unfold until embedding is encountered
- Find a call which narrows the search space (less-branching heuristics)
- Join the result of unfolding the selected call with the other calls not unfolded
- Continue driving the constructed conjunction

Less-branching Heuristics

Less-branching heuristics is used to select a call to unfold

If a call in the context unfolds into less branches than it does in isolation, select it

We implemented the Conservative Partial Deduction and compared it with CPD¹ on the following relations

- Four implementations of an evaluator of logic formulas
- Two implementations of a typechecker for a simple language

¹ECCE partial deduction system

ECCE is a partial deduction system for PROLOG

To compare to ECCE we did the following steps:

- Convert MINIKANREN program into PROLOG
- Run the default transformation with ECCE
- Convert generated PROLOG back into MINIKANREN

Evaluator of Logic Formulas: Order of Calls

boolean connective last

```
let rec evalo fm s r =  
  ocanren { fresh v x y a b in  
    (fm ≡ var v & lookupo v s r) |  
    (fm ≡ neg x & evalo x s a & noto a r) |  
    (fm ≡ conj x y & evalo x s a & evalo y s b & ando a b r) |  
    (fm ≡ disj x y & evalo x s a & evalo y s b & oro a b r) }
```

Evaluator of Logic Formulas: Order of Calls

boolean connective last

```
let rec evalo fm s r =  
  ocanren { fresh v x y a b in  
    (fm ≡ var v & lookupo v s r) |  
    (fm ≡ neg x & evalo x s a & noto a r) |  
    (fm ≡ conj x y & evalo x s a & evalo y s b & ando a b r) |  
    (fm ≡ disj x y & evalo x s a & evalo y s b & oro a b r) }
```

boolean connective first

```
let rec evalo fm s r =  
  ocanren { fresh v x y a b in  
    (fm ≡ var v & lookupo v s r) |  
    (fm ≡ neg x & noto a r & evalo x s a) |  
    (fm ≡ conj x y & ando a b r & evalo x s a & evalo y s b) |  
    (fm ≡ disj x y & oro a b r & evalo x s a & evalo y s b) }
```

Evaluator of Logic Formulas: Complexity of Relations

table-based implementation

```
let rec ando x y r =  
  ocanren {  
    (x ≡ true & y ≡ true & r ≡ true) |  
    (x ≡ true & y ≡ false & r ≡ false) |  
    (x ≡ false & y ≡ true & r ≡ false) |  
    (x ≡ false & y ≡ false & r ≡ false) }
```

Evaluator of Logic Formulas: Complexity of Relations

table-based implementation

```
let rec ando x y r =  
  ocanren {  
    (x ≡ true & y ≡ true & r ≡ true) |  
    (x ≡ true & y ≡ false & r ≡ false) |  
    (x ≡ false & y ≡ true & r ≡ false) |  
    (x ≡ false & y ≡ false & r ≡ false) }
```

implementation via nand^o

```
let ando x y r =  
  ocanren {  
    fresh xy in  
      (nando x y xy & nando xy xy r) }  
  
let rec nando x y r =  
  ocanren {  
    (x ≡ true & y ≡ true & r ≡ false) |  
    (x ≡ true & y ≡ false & r ≡ true) |  
    (x ≡ false & y ≡ true & r ≡ true) |  
    (x ≡ false & y ≡ false & r ≡ true) }
```

$\overline{\Gamma \vdash IConst\ i : Int}$	$\overline{\Gamma \vdash BConst\ b : Bool}$	$\overline{\Gamma \vdash Var\ v : \tau} \quad \Gamma[v] \equiv \tau$
$\frac{\Gamma \vdash t : Int, \Gamma \vdash s : Int}{\Gamma \vdash t + s : Int}$	$\frac{\Gamma \vdash t : \tau, \Gamma \vdash s : \tau}{\Gamma \vdash t = s : Bool}$	$\frac{\Gamma \vdash v : \tau_v, (\tau_v :: \Gamma) \vdash b : \tau}{\Gamma \vdash \underline{let}\ v\ b : \tau}$
$\frac{\Gamma \vdash t : Int, \Gamma \vdash s : Int}{\Gamma \vdash t * s : Int}$	$\frac{\Gamma \vdash t : Int, \Gamma \vdash s : Int}{\Gamma \vdash t < s : Bool}$	$\frac{\Gamma \vdash c : Bool, \Gamma \vdash t : \tau, \Gamma \vdash s : \tau}{\Gamma \vdash \underline{if}\ c\ \underline{then}\ t\ \underline{else}\ s : \tau}$

Figure: Typing rules implemented in typecheck^o relation

Typechecker-Term Generator: Evaluation

Implementations:

- Hand-coded typing rules in `MINIKANREN`
- Generated from functional typechecker by relational conversion

Discussion: Order of Answers

Partial deduction changes the order of answers

Measuring time when order is different does not make much sense

Partial deduction reduces the number of unifications needed
to compute an answer

Discussion: Deterministic Unfolding and Tupling

ConsPD often splits too much failing to do tupling

Because of the deterministic unfolding, ECCE fails to tuple `maxmin`

```
max([],M,M).  
max([H|T],N,M) :- H <= N, max(T,N,M).  
max([H|T],N,M) :- H > N, max(T,H,M).
```

```
min([],M,M).  
min([H|T],N,M) :- H > N, min(T,N,M).  
min([H|T],N,M) :- H <= N, min(T,H,M).
```

```
maxmin([H],H,H).  
maxmin([H|T],Max,Min) :- max(T,H,Max),min(T,H,Min).
```

Conclusion

- We developed and implemented Conservative Partial Deduction
 - Less-branching heuristics
- Evaluation shows some improvement, but not for every query
- Future work:
 - Develop models to predict execution time
 - Develop specialization which is more predictable, stable and well-behaved
